T.A. Buishand (1982): "Monthly and annual amounts of long-term rainfall records in The Netherlands."
Royal Netherlands Meteorological Institute (KNMI), Tech. Rep. 26.

Abstract

This report gives the monthly and annual amounts of 24 long-term rainfall records in The Netherlands. The geographical location of the rainfall stations is given in Fig. 1 on page 2. The records have an average length of about 100 years. The beginning date of the observations ranges from January 1847 (Groningen) to October 1911 (Dwingeloo). A survey is given of the monthly and annual averages for the 10-year periods 1851-1860, 1861-1870, etc.

An extensive statistical analysis revealed that only the data of West-Terschelling, Heerde, Denekamp, Hoofddorp, Winterswijk, Axel, Heusden/Andel and Roermond may be considered as homogeneous records. The data in this publication have not been corrected for departures from homogeneity. A detailed description (in English) about possible changes in the mean amount of rainfall for the records in this report is given in T.A. Buishand (1981): "The analysis of homogeneity of long-term rainfall records in The Netherlands" - Royal Neth. Meteor. Inst. (KNMI), Scient. Rep. 81-7.

MAANDSOMMEN EN JAARSOMMEN VAN ENKELE LANGJARIGE NEERSLAGREEKSEN IN NEDERLAND

Maandsommen, jaarsommen en tienjaarlijkse gemiddelden per station 10

1. Overzicht neerslagstations

In deze publikatie zijn de maand- en jaarsommen (tot en met 1980) gegeven van 24 neerslagreeksen. Hieraan toegevoegd is een overzicht van de gemiddelde maand- en jaarwaarden voor de 10-jarige tijdvakken 1851-1860, 1861-1870, enz.
Fig. 1 geeft de plaatsen aan waarop de neerslagreeksen betrekking hebben. Daarnaast is in Tabel 1 vermeld voor welke tijdvakken neerslaggegevens beschikbaar zijn. De kortste reeks is die van Dwingeloo (ruim 69 jaren), terwijl de langste reeks die van Groningen is (134 jaren). De gemiddelde lengte van de reeksen is ongeveer 100 jaren.

De gegevens van een reeks zijn niet altijd van hetzelfde station afkomstig. Een overzicht van de reeksen die van meer dan één station afkomstig zijn wordt gegeven in Tabel 2. Het feit dat de neerslagcijfers steeds betrekking hebben op hetzelfde neerslagstation wil echter niet zeggen dat de regenmeter steeds op dezelfde plaats heeft gestaan. De meeste stations zijn meerdere malen over kleine afstanden verplaatst zonder dat de naam (of het nummer) behoefde te worden gewijzigd. Daarnaast zijn korte onderbrekingen in de reeksen aangevuld met gegevens van naburige stations. Hierop zal in de volgende paragraaf nader worden ingegaan.

2. Herkomst van de gegevens

Met uitzondering van de gegevens van Andel voor het tijdvak feb. 1942-dec. 1950 waren de dagsommen* van de reeksen in Tabel 1 vastgelegd op een tweetal magneetbanden, n.l. de CODE2X-tape en de REGEN-tape.
De CODE2X-tape bevat slechts de dagsommen* van de hier gegeven reeksen

---

* Onder de dagsom wordt de neerslaghoeveelheid verstaan die 's ochtends wordt afgetapt (thans om 8 uur GMT). De dagsom wordt genoteerd op de datum van aftapping, zodat de neerslagsom van bijv. juli betrekking heeft op het tijdvak dat begint op de ochtend van 30 juni en eindigt op de ochtend van 31 juli.

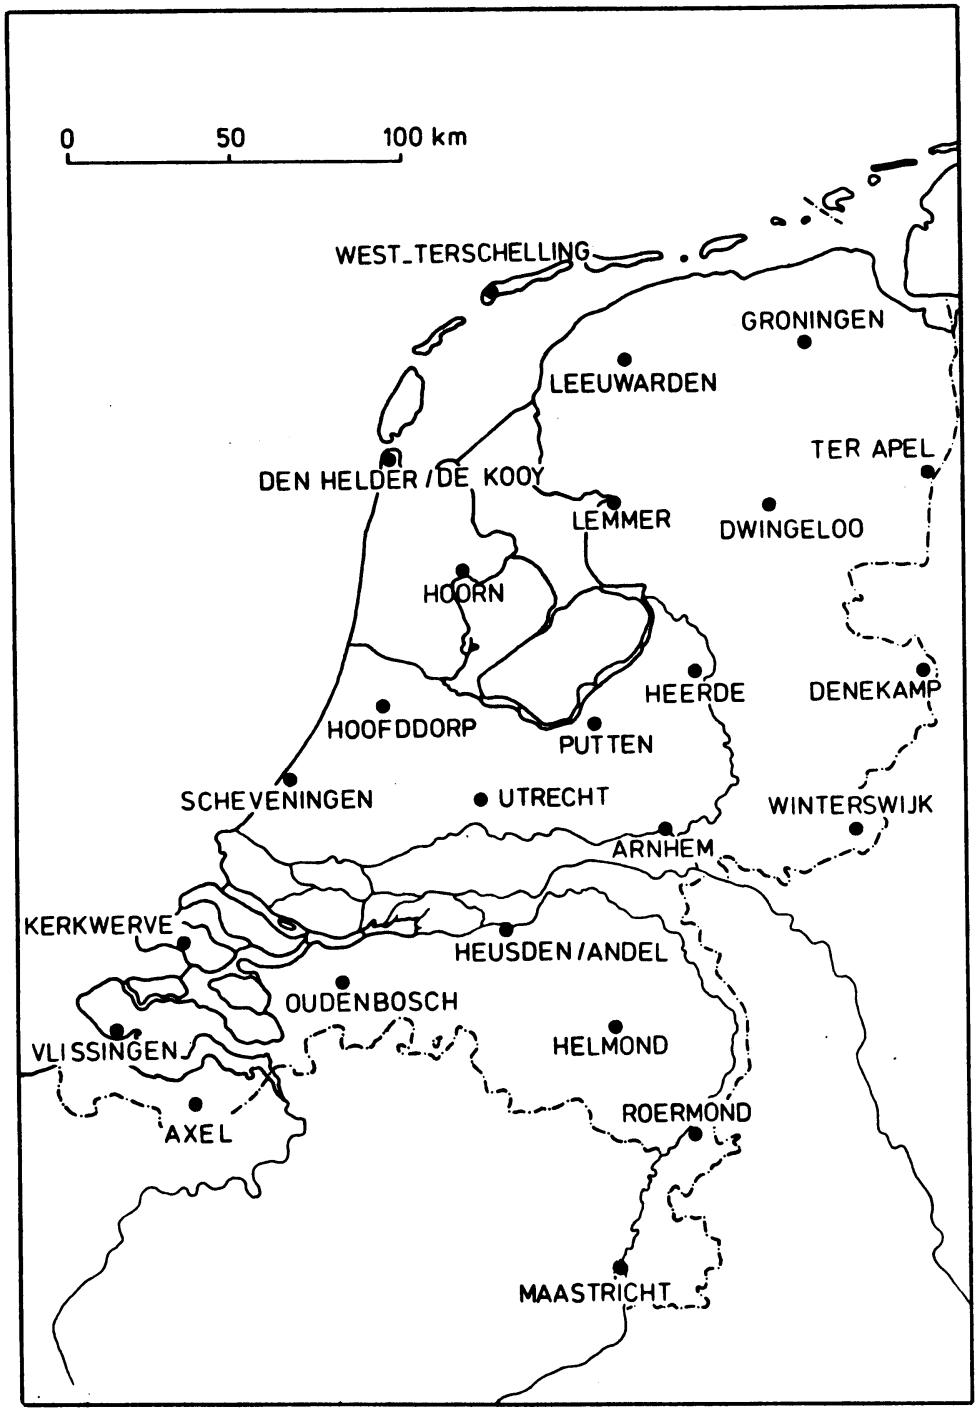

Fig. 1. Plaatsen waarop de neerslagreeksen in deze publikatie betrekking hebben.

Tabel 1

Overzicht van de 24 reeksen waarvoor in deze publikatie de maand- en jaarsommen worden gegeven.

* Gedurende het tijdvak dec. 1881-feb. 1885 werden op Terschelling geen regenwaarnemingen voor het KNMI verricht. Deze onderbreking is aangevuld met gegevens van naburige stations (Hollum, St. Jacobi Parochie).

en wel voor het tijdvak 1847-1953. Op de REGEN-tape zijn de dagsommen* vanaf 1951 van alle KNMI-stations vastgelegd.
De maand- en jaarsommen konden eenvoudig verkregen worden door de dagsommen* met behulp van de computer op te tellen. Voor het tijdvak 1847-1951 werd gebruik gemaakt van de CODE2X-tape, terwijl de getallen voor het tijdvak 1952-1980 betrekking hebben op de REGEN-tape. De maandsommen van Andel voor het tijdvak feb. 1942-dec. 1951 zijn overgenomen uit het jaarboek van regenwaarnemingen.

Voordat de gegevens op magneetband geschreven zijn, heeft een controle op twijfelachtige waarnemingen plaatsgevonden en zijn meerdaagse sommen gesplitst. Op de CODE2X-tape zijn alle ontbrekende waarden aangevuld met behulp van gegevens van naburige stations. Hierbij moet echter opgemerkt worden dat in de beginjaren een naburig station soms erg ver verwijderd was.
Daarentegen zijn op de REGEN-tape onderbrekingen niet aangevuld indien de onderbreking langer dan 10 dagen duurde. Dergelijke lange onderbrekingen kwamen bij een aantal van de hier gegeven reeksen voor. Met behulp van het jaarboek van regenwaarnemingen zijn deze onderbrekingen later toch aangevuld met gegevens van een nabijgelegen station.
Het gevolg van deze correcties en aanvullingen is dat de maand- en jaarsommen in deze publikatie soms verschillen van die in de jaar- en regenboeken. Aan de hier gegeven cijfers moet men in het algemeen een grotere betrouwbaarheid toekennen.

Neerslagwaarnemingen uit vroegere tijden zijn meestal minder betrouwbaar dan de recentere. Pas na de tweede wereldoorlog is de controle op de waarnemingsgegevens sterk geïntensifeerd waardoor de kwaliteit aanzienlijk verbeterd is.
Bij de CODE2X-tape is het aanvullen van ontbrekende waarden en het splitsen van meerdaagse sommen minder zorgvuldig geschied dan bij de REGEN-tape. Daarnaast zijn de gegevens op de CODE2X-tape minder uit-

---

* Onder de dagsom wordt de neerslaghoeveelheid verstaan die 's ochtends wordt afgetapt (thans om 8 uur GMT). De dagsom wordt genoteerd op de datum van aftapping, zodat de neerslagsom van bijv. juli betrekking heeft op het tijdvak dat begint op de ochtend van 30 juni en eindigt op de ochtend van 31 juli.

voerig gecontroleerd. Dit legt enige beperkingen op aan het gebruik van de cijfers voor het tijdvak 1847-1951. Zo zijn deze cijfers bijvoorbeeld niet geschikt om correlatieberekeningen tussen stations uit te voeren daar de uitkomsten van dergelijke berekeningen zeer gevoelig zijn voor de kwaliteit van de gegevens.

3. De homogeniteit van de reeksen

In de eerste paragraaf werd reeds opgemerkt dat de regenstations vaak verplaatst zijn. Daarnaast is niet altijd met hetzelfde type instrument gemeten. Aanvankelijk was er een grote verscheidenheid aan instrumenten en liep ook de opstellingshoogte van de regenmeter sterk uiteen. In het eerste decennium van deze eeuw werd het meetnet gestandaardiseerd. De standaardisatie hield in dat overal met hetzelfde type regenmeter werd gemeten, die bovendien steeds op dezelfde hoogte (bovenrand 1,50 m boven maaiveld) stond opgesteld. Van dit laatste is echter soms afgeweken (zie 3.2). In het tijdvak 1946-1955 werd de opstellingshoogte verlaagd en wel tot 0,40 m, om de windfout te reduceren. Met ingang van 1962 werd een nieuw type standaardregenmeter geïntroduceerd dat thans op vrijwel alle stations aanwezig is. De hoogte van de bovenrand van dit instrument bedraagt eveneens 0,40 m.

Dergelijke veranderingen kunnen tot gevolg hebben dat de statistische eigenschappen van een reeks in de tijd veranderen. Men spreekt dan van een inhomogene reeks. Een onderzoek naar mogelijke inhomogeniteiten in de hier gepubliceerde reeksen werd verricht door Buishand (1981). Uit dit onderzoek bleek dat de volgende reeksen redelijk homogeen waren: West-Terschelling, Heerde, Denekamp, Hoofddorp, Winterswijk, Axel, Heusden/Andel en Roermond. Bij de andere reeksen waren er sterke aanwijzigingen voor inhomogeniteiten. Nadere bijzonderheden over inhomogeniteiten zullen hieronder worden gegeven. De in deze publikatie gegeven maand- en jaarsommen zijn niet voor inhomogeniteiten gecorrigeerd.

3.1. De gegevens uit de jaren voor de standaardisatie van het meetnet

Voorzichtigheid is geboden met gegevens uit de 19e eeuw en de eerste jaren van de 20e eeuw. Van veel stations is niets bekend over de toen gebruikte regenmeter en de opstellingshoogte van het instrument. Ook is er weinig of geen informatie over de situatie van het waarnemingsterrein.

Er zijn sterke aanwijzingen dat van veel stations de opgegeven neerslaghoeveelheden te laag zijn. Van de hier gepubliceerde reeksen is dit het geval bij de volgende stations: Lemmer, Groningen, Hoorn, Scheveningen, Putten, Vlissingen, Kerkwerve, Oudenbosch, Helmond en Maastricht. Op basis van het jaargemiddelde moet men denken aan een correctie van ongeveer 10%, behalve voor de reeksen van Vlissingen en Maastricht.
In Vlissingen bevond de regenmeter zich tot november 1905 op een dak (hoogte: 8 à 10 m). Uit vergelijkende waarnemingen in 1905 bleek dat de met deze regenmeter gemeten neerslaghoeveelheden ongeveer 20% te laag waren. Het is echter twijfelachtig of deze correctie toegepast kan worden voor het gehele tijdvak jan. 1855-okt. 1905 (de jaarsom voor 1857 bedraagt slechts 40,5 mm!).
Tot mei 1904 was in Maastricht de opstelling van de regenmeter (hoogte regenmeter 2 m) ongunstig, waardoor de opgegeven neerslaghoeveelheden te laag zijn. Door Hartman (1913) werd voor de gemiddelde jaarsom een correctie vastgesteld van ongeveer 15%.
Tot september 1904 was in Oudenbosch de opstelling van de regenmeter ongunstig (stond te dicht bij een rij bomen). De neerslagmeting in Groningen is vermoedelijk verbeterd bij een verplaatsing van het station in 1906.
In Hoorn is dit waarschijnlijk het geval geweest in december 1904 (overgang van regenstation naar termijnstation).
Bij de stations Lemmer, Scheveningen, Putten, Kerkwerve en Helmond is het niet mogelijk een exacte datum aan te geven waarop een verbetering van de neerslagmeting plaatsvond. Dit is vermoedelijk omstreeks 1905 gebeurd, behalve bij het station Lemmer waarvoor het jaargemiddelde tot 1925 te laag is. De neerslagreeksen van Lemmer en Putten bevatten daarnaast vele twijfelachtige waarnemingen.

3.2. Inhomogeniteiten ten gevolge van veranderingen in de opstellingshoogte.

De verandering van de opstellingshoogte van de regenmeters in de jaren 1946-1955 heeft in principe tot een vermindering van de windfout geleid. Het is echter niet zo dat hierdoor bij alle stations een ernstige inhomogeniteit in de waarnemingsreeks is onstaan. Van de hier gepubliceerde reeksen heeft de verlaging van de opstellingshoogte vermoedelijk alleen een belangrijk effect (5 à 10% op basis van de gemiddelde jaarsom) gehad

bij de weinig beschutte kuststations Den Helder, Scheveningen, Vlissingen en Kerkwerve (Braak, 1945; Buishand en Velds, 1980).

In Arnhem bevond de bovenrand van de regenmeter zich gedurende het tijdvak jan. 1906-jan. 1927 op een hoogte van 2,5 à 3 m boven het maaiveld. Bovendien stond de regenmeter op een tamelijk open terrein. Hierdoor zijn de gegeven neerslaghoeveelheden voor deze jaren te laag. Voor de gemiddelde jaarsom bedraagt de correctie ongeveer 10%.

Gedurende het tijdvak dec. 1930-dec. 1952 bevond de regenmeter te Maastricht zich op een kleine toren (hoogte 29,6 m) op het dak van het instituut. Het is mogelijk dat de regenmetingen al enige tijd vóór dec. 1930 uitsluitend op het dak verricht werden. De opgegeven neerslaghoeveelheden voor deze jaren zijn daardoor te laag; voor de gemiddelde jaarsom bedraagt de correctie ongeveer 15%.

3.3. Overige inhomogeniteiten

Door Buishand en Velds (1980) werden op de neerslaggegevens van Leeuwarden de volgende correcties toegepast. Voor het tijdvak sep. 1920-14 sep. 1935 werden de neerslagsommen met een factor 1,05 vermenigvuldigd (vanwege een ongunstige opstelling van het instrument). Tevens werden vanaf 1 juni 1974 de volgende correcties toegepast: 1,06 (jun.-aug.), 1,10 (sep.-nov., mrt.-mei) en 1,14 (dec.-feb.). Deze laatste correcties waren noodzakelijk omdat met een afwijkend instrument werd gemeten. De hier gepubliceerde gegevens van Leeuwarden zijn echter niet gecorrigeerd.

Uit een vergelijking met omringende stations blijkt dat tot 1925 de gemeten neerslaghoeveelheden te Dwingeloo te laag zijn. Voor de gemiddelde jaarsom bedraagt de correctie ongeveer 10%.
Voor het tijdvak 1907-1979 is er bij de reeksen van Scheveningen en Putten enige statistische evidentie voor inhomogeniteiten. Er is echter niet voldoende informatie in het stationsarchief aanwezig om hiervoor een verklaring te geven. De reeks van Schevingen kan enigszins gecorrigeerd worden door tot januari 1946 een correctie voor de windfout toe te passen.
Door een ongunstige opstelling van de regenmeter zijn de gegeven neerslaghoeveelheden van Helmond voor het tijdvak feb. 1946-mei 1974 te laag. De correctie voor het jaargemiddelde bedraagt 5 à 10%.

De invoering van een ander type regenmeter sinds 1962 kan in principe een geringe inhomogeniteit veroorzaakt hebben in de waarnemingsreeksen. Hoewel onderzoek naar de grootte van een mogelijk effect vooralsnog geen eensluidende resultaten heeft opgeleverd (Denkema, 1980, Warmerdam, 1981), mag men aannemen dat de verandering in de gemiddelde gemeten neerslaghoeveelheid kleiner is dan 5%. Het heeft daarom weinig zin hiervoor te corrigeren.

4. Dankbetuiging

De auteur is dank verschuldigd aan de heer P.C.T. van der Hoeven voor het verzorgen van de computer-uitvoer van de tabellen.
